

3.4 Equations and Graphs of Polynomial Functions: Part 1

Find the zeros of the function

$$f(x) = \frac{1}{2}(x-1)(x+2)(x-3)$$

set $f(x) = 0$

$$0 = \frac{1}{2}(x-1)(x+2)(x-3)$$

$$x-1=0$$

$$x=1$$

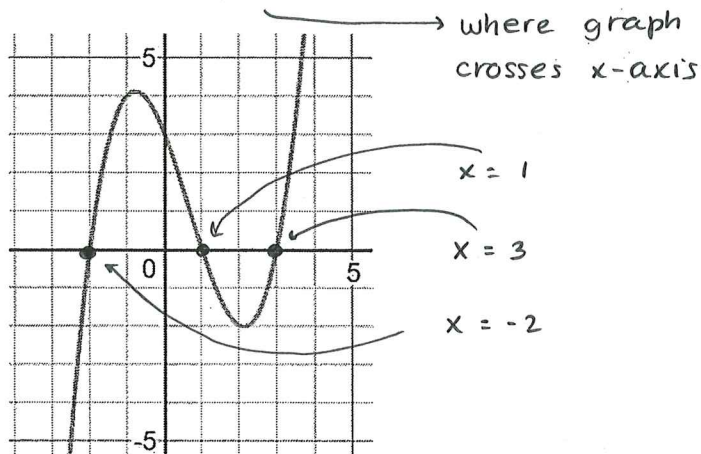

$$x+2=0$$

$$x=-2$$

$$x-3=0$$

$$x=3$$

Find the x-intercepts of the function

The zeroes of a polynomial function are the x-intercepts of the graph of the function.

They are also known as roots

Multiplicity of a zero/root : how many times a particular number is a zero for a given polynomial.

$$f(x) = (x-1)^2(x+4)$$

Find the "zeroes"

$$0 = (x-1)^2(x+4)$$

$$0 = (x-1)(x-1)(x+4)$$

$$x-1=0$$

$$x=1$$

$$x+4=0$$

$$x=-4$$

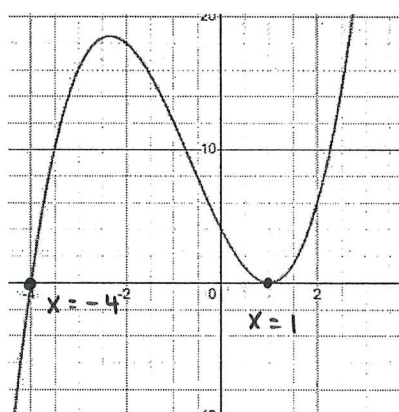

2 zeroes of

$$x=1$$

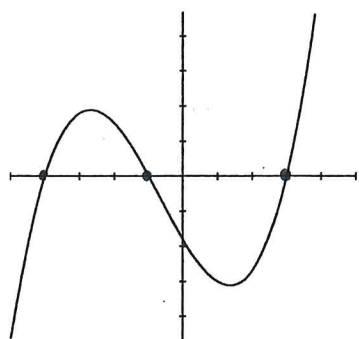

► Multiplicity of 2

1 zero of $x=-4$

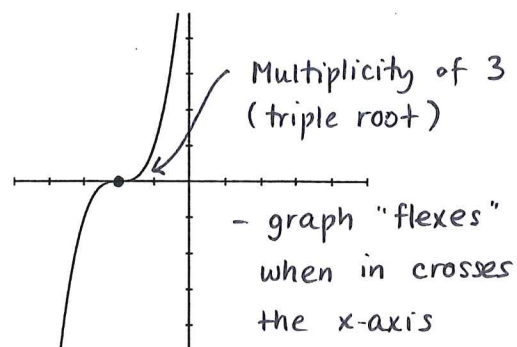

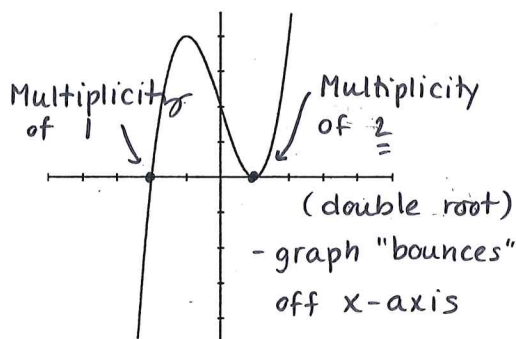

► Multiplicity of 1

To determine the multiplicity of a zero/root from a graph, consider the following:

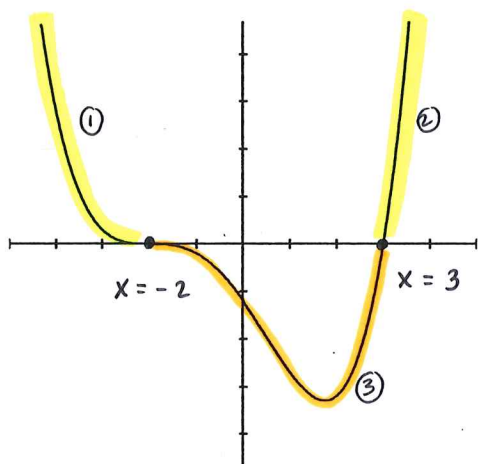

Multiplicity of 1
for each root/zero

- Zeroes of **ODD** multiplicity change sign at the zero. (graph crosses x-axis)
- Zeroes of **EVEN** multiplicity do not change sign at the zero. (graph doesn't cross x-axis, it bounces off)

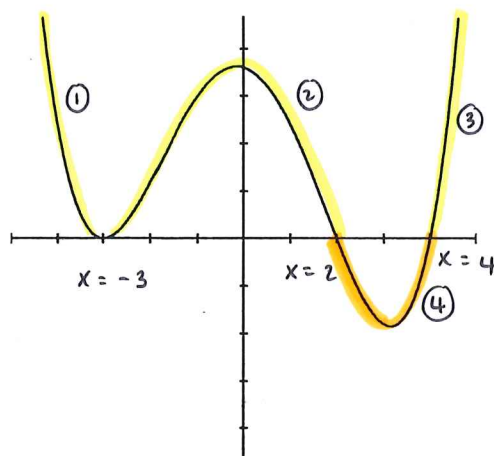

Example 1: For each graph, state the x-intercepts, the intervals where the function is positive and negative, whether the zeroes are of multiplicity 1, 2, or 3.

a)

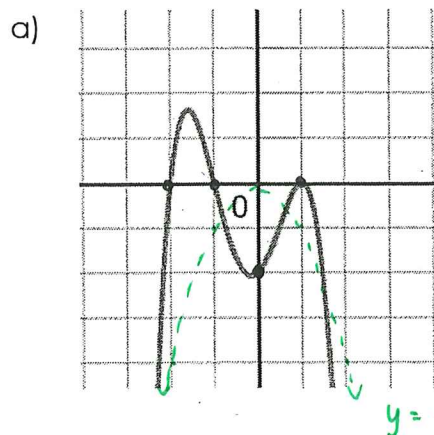

x-intercepts	$(-2, 0)$ and $(3, 0)$
Multiplicity	$x = -2$ mult. of 3 ; $x = 3$ mult. of 1
Positive interval	(above x-axis) $x < -2$ and $x > 3$ ① ②
Negative interval	(below x-axis) $-2 < x < 3$ ③

b)

x-intercepts	$(-3, 0)$, $(2, 0)$, $(4, 0)$
Multiplicity	$x = -3$ mult. of 2 $x = 2$ and $x = 4$ mult. of 1 each
Positive interval	① $x < -3$ ③ $x > 4$ ② $-3 < x < 2$
Negative interval	④ $2 < x < 4$

Example 2: For the following polynomial functions determine: the sign of the leading coefficient, the x-intercepts, multiplicity of the zeros, and an additional point. Use the information to find the equation of the polynomial function.

$$y = a(x+2)(x+1)(x-1)^2$$

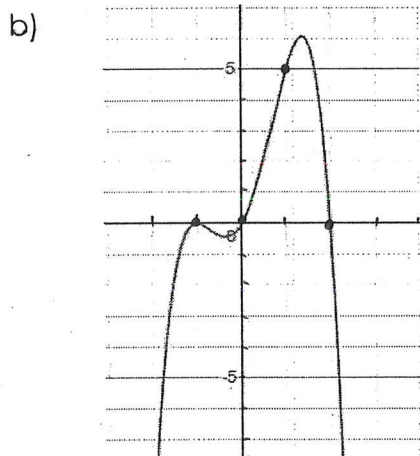

$$-2 = a(0+2)(0+1)(0-1)^2$$

$$-2 = 2a$$

$$-1 = a$$

$$y = -(x+2)(x+1)(x-1)$$

Sign of Leading Coefficient	negative
x-intercepts	$(-2, 0)$ $(1, 0)$ $(-1, 0)$
Multiplicity	$(-2, 0)$ $(1, 0)$ $(-1, 0)$ mult. of 2 mult. of 1
Additional Point	$(0, -2)$

$$y = a(x+1)^2(x)(x-2)$$

$$5 = a(1+1)^2(1)(1-2)$$

$$5 = a(2)^2(1)(-1)$$

$$5 = -4a$$

$$-\frac{5}{4} = a$$

$$y = -\frac{5}{4}(x+1)^2(x)(x-2)$$

Sign of Leading Coefficient	negative
x-intercepts	$(-1, 0)$ $(2, 0)$ $(0, 0)$
Multiplicity	$(-1, 0)$ $(2, 0)$ $(0, 0)$ mult. of 2 mult. of 1
Additional Point	$(1, 5)$

c) A degree 4 polynomial function has zeroes of -4, 1 (both multiplicity 1) and -2 (multiplicity 2). The constant term of the function is -3. \rightarrow y-intercept $(0, -3)$

$$y = a(x+4)(x-1)(x+2)^2$$

$$-3 = a(0+4)(0-1)(0+2)^2$$

$$-3 = -16a$$

$$a = \frac{3}{16}$$

$$y = \frac{3}{16}(x+4)(x-1)(x+2)^2$$

Sign of Leading Coefficient	unsure
x-intercepts	$(-4, 0)$ $(-2, 0)$ $(1, 0)$
Multiplicity	$(-4, 0)$ $(-2, 0)$ $(1, 0)$ mult. of 2 mult. of 1
Additional Point	$(0, -3)$
